rawurlencode template operator

The rawurlencode template operator: no named parameters, registered by eZTemplatePHPOperator.

Source file: doc/eng-us/examples/template-operators/rawurlencode.md Last changed 2026-11-04
https://doc.exponential.earth/exphelp/viewer/examples/template-operators/rawurlencode.md

The rawurlencode template operator

Registered in `kernel/common/eztemplateautoload.php` by the class `eZTemplatePHPOperator` (`lib/eztemplate/classes/eztemplatephpoperator.php`). It calls the PHP function `rawurlencode()`, listed in `settings/template.ini [PHP] PHPOperatorList[]`. The same class also registers: urlencode, urldecode, rawurldecode.

Parameters

The class does not describe its parameters (no `namedParameterList()`); see its source for what it reads.

The operator works on its input: the value before `|`.

Example

Built from the parameter list above; the values are placeholders (the operator's template hints decide whether it takes an input).

Template

```
{$value|rawurlencode}
```

In a shipped template

The first use in the templates of this installation, `design/admin/templates/migration/rollback.tpl` line 23:

Template

```
<form method="post" action={concat( 'migration/rollback/', $target|rawurlencode )|ezurl} class="a
4-form">
```
