fetch('collaboration', 'tree_count')

The fetch function tree_count of the collaboration module: 4 parameter(s), 1 required.

Source file: doc/eng-us/examples/fetch-functions/collaboration/tree_count.md Last changed 2026-11-04
https://doc.exponential.earth/learninminutes/exphelp/viewer/examples/fetch-functions/collaboration/tree_count.md

Defined in `kernel/collaboration/function_definition.php`; it calls `eZCollaborationFunctionCollection::fetchObjectTreeCount()` (`kernel/collaboration/ezcollaborationfunctioncollection.php`). Operation type: read.

Parameters

Parameter	Type	Required	Default
parent_node_id		yes	
class_filter_type		no	false
class_filter_array		no	false
depth		no	0

Example

In a template (the values are placeholders of each parameter's type):

Template

```
{def $result = fetch( 'collaboration', 'tree_count', hash( 'parent_node_id', $parent_node_id ) )}
{* with every parameter *}
{def $all = fetch( 'collaboration', 'tree_count', hash( 'parent_node_id', $parent_node_id,
                                                        'class_filter_type', $class_filter_type,
                                                        'class_filter_array', $class_filter_array,
                                                        'depth', 0 ) )}
```

In PHP, the same function through the function handler (`lib/ezutils/classes/ezfunctionhandler.php`):

PHP

```
$result = eZFunctionHandler::execute( 'collaboration', 'tree_count', array( 'parent_node_id' => $parent_node_id ) );
```
