autoload (migration step)

Source file: doc/eng-us/examples/migration-steps/autoload.md Last changed 2026-11-04
https://doc.exponential.earth/learninminutes/exphelp/viewer/examples/migration-steps/autoload.md

autoload

Regenerates the autoload array of the extensions or of the kernel classes extensions replace.

A step of a YAML migration with `type: autoload`. The class `expMigrationStepAutoload` (`kernel/classes/migration/steps/expmigrationstepautoload.php`) is registered in `settings/migration.ini` `[StepSettings] StepTypeList[autoload]`.

Keys

Key	Type	Default	What it is
`scope`	`string`: `extension`, `kernel-override`	`"extension"`	extension: the classes of the extensions; kernel-override: the kernel classes extensions replace

Besides these, every step takes the keys of the engine: `type`, `mode`, `if`, `references`, `environments`, `engines` and `comment` (the file format). A key of type `identifier` names a node, an object or another part of the installation by id, remote id, path or name (identifiers).

Values for references

`references: { <name>: <value> }` keeps a value of the step's result as `${ref.<name>}` for the steps and migrations after it:

Value	What it is
`file`	the autoload array written, below the root

Undoing

Every step of this type undoes itself when its migration is rolled back without `down:`.

It touches no cache.

Example

YAML

```yaml
- type: autoload
  scope: extension
```
