```
*Title: New eZXML tag <embed-inline/>.

*Description:

"embed-inline" tag is an analog of the "embed" tag. Differences are described
below:

- "embed" tag is "block" tag, but "embed-inline" is "inline". This means that
  templates for "embed-inline" can't contain block tags, but only tags
  that can be placed within HTML paragraphs. "embed-inline" tag's content is placed
  inside paragraphs and can be wrapped by other inline tags. "embed" tags "breaks"
  paragraphs in the output and is rendered outside.

- By default "embed" tag renders objects using "embed" view of the content module.
  "embed-inline" tag renders objects using "embed-inline" view. You should have
  this in mind while making template overrides. You can also use another view with
  any of these tags by adding attribute "view='...'".

- Use "embed-inline" if you want to insert an image inside the text line, but use
  "embed" if you want to insert it between text paragraphs.

*Documentation:

All parameters of "embed-inline" tag are equivalent to those of "embed" tag.
